ACADEMIC YEAR: 2025–2026

ABSTRACT

The Bank Management System is a console-based application developed in C++ to manage customer bank accounts efficiently. It uses file handling techniques to store account information permanently in a binary file. The system provides functionalities such as account creation, deposit, withdrawal, balance

inquiry, and displaying all account details. A menu-driven interface ensures smooth navigation and ease of use. This project demonstrates the practical implementation of object-oriented programming and file handling concepts in C++.

OBJECTIVES

- To develop a console-based banking application using C++.
- To implement file handling for permanent account storage.
- To perform banking operations like deposit, withdrawal, and balance inquiry.
- To design a user-friendly menu-driven system.
- To understand real-time banking data management techniques.

FEATURES

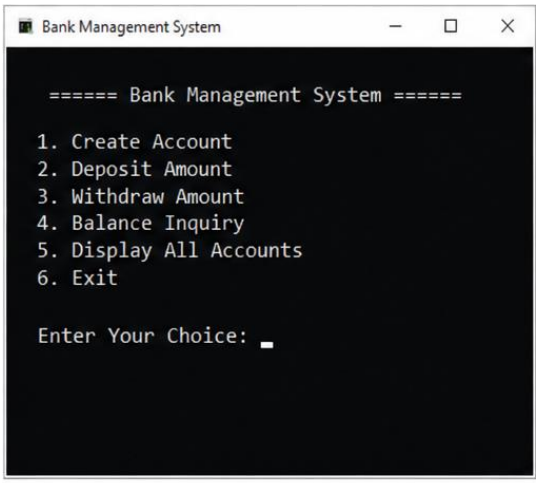

- Create new bank account
- Deposit amount
- Withdraw amount
- Balance inquiry
- Display all account details

- Persistent data storage using binary file (bank.dat)
- Simple and user-friendly menu interface

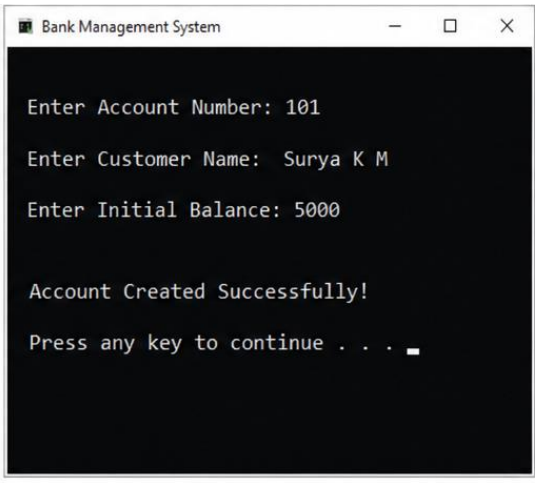

ALGORITHM

1. Start the program
2. Display menu options
3. Read user choice
4. Perform action based on choice:
   a. Create Account → Take input and store in file
   b. Deposit Amount → Update balance in file
   c. Withdraw Amount → Deduct amount from balance
   d. Balance Inquiry → Search and display account details
   e. Display All Accounts → Read and show all records
5. Repeat until user selects Exit
6. Stop the program

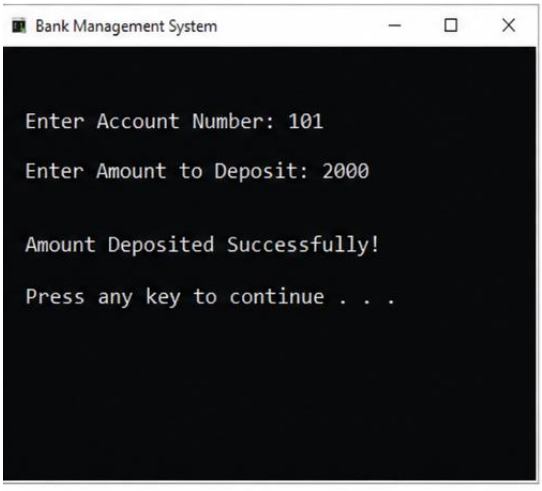

OUTPUT

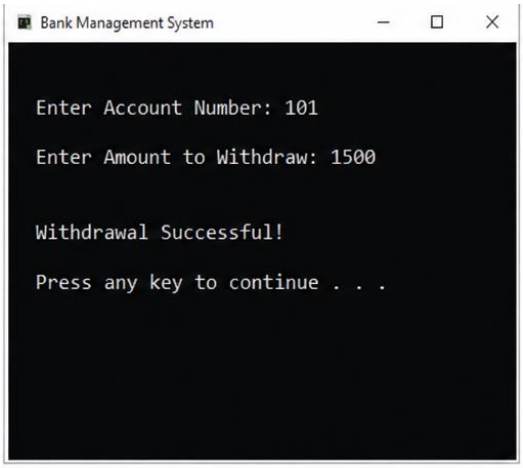

1. Main Menu Screen

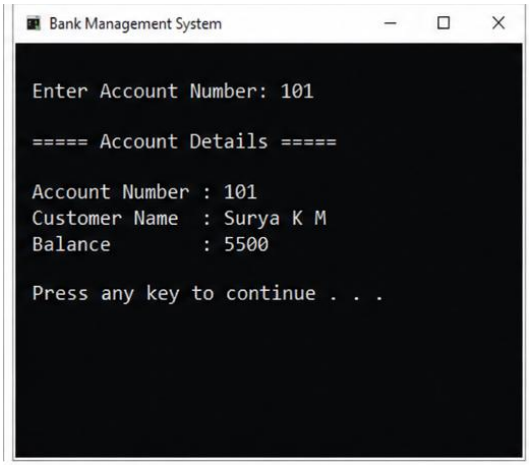

2. Create Account Output

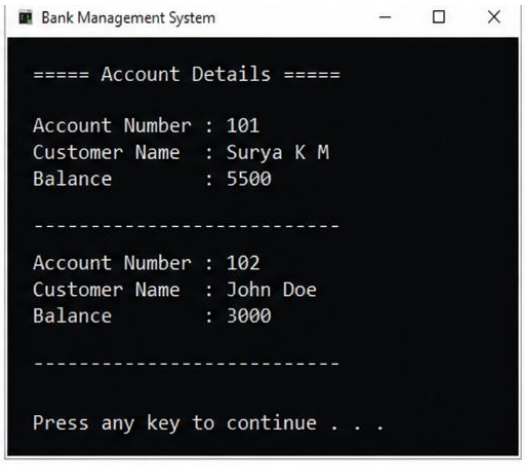

3. Deposit Amount Output

4. Withdraw Amount Output

5. Balance Inquiry Output

6. Display All Accounts Output

CONCLUSION

The Bank Management System successfully demonstrates the use of file handling and object-oriented programming in C++. It allows efficient management of bank accounts with essential operations like account creation, deposit, withdrawal, and balance inquiry. The use of binary files ensures data persistence even after program termination. This project improves understanding of real-world banking applications and enhances programming skills in C++.
